

**ABSTRACT**

A box for payout of a filamentary product such as cable or wire that is wound in a coil inside of the box. The box is constructed to retain the coil securely and utilize material in an efficient manner. Particularly, the box is adapted to retain a figure-eight coil of wire, which is often formed in an irregular shape. The box may include a payout tube that extends from a point outside of the box through a wall of the coil and into an interior point of the coil. The box serves to retain such a payout tube with an efficient amount of material and also provides for an improved method of assembling the box, the coil, and the payout tube.
